

Free Infra Template

Can't find a template that fits your exact requirements? Request a free custom infrastructure or deployment template from the QuickInfra team. Describe what you need and we'll build it for you.

What is Free Infra Template?

QuickInfra's template library covers common infrastructure and deployment patterns, but every organisation has unique requirements. The Free Infra Template section lets you request a fully custom template — built specifically for your use case — at no cost.

Whether you need an infrastructure template for a specific cloud architecture, a deployment template for a custom application stack, or a script template for a particular automation workflow, describe what you need and the QuickInfra team will build and deliver it to your account. Once added, it appears in your template library ready to copy as a project and use.

 **Note:** This is a complimentary service included with your QuickInfra subscription. There is no limit on the number of template requests — use it whenever the existing library does not cover your use case.

Key Things to Know

Be as specific as possible in your request — include cloud provider, region preferences, instance types, and any specific tooling or configuration requirements.

Templates are delivered to your account directly — you will be notified when it is ready to use.

Delivered templates follow the same structure as all QuickInfra templates — copy them as projects and customise from there.
