

Services

QuickInfra offers professional managed services for teams that need expert hands-on support beyond the platform itself. From CI/CD pipeline setup to advanced Kubernetes and GitOps implementations — we handle the hard parts so your team can focus on building.

What are Services?

Some infrastructure challenges go beyond what a self-service platform can solve alone. The Services section is where you engage the QuickInfra team directly for professional services — hands-on work delivered by engineers who specialise in cloud infrastructure and DevOps practices.

Whether you want a fully managed CI/CD pipeline built for your codebase, a production-grade Kubernetes cluster set up with autoscaling and monitoring, or a complete GitOps workflow implemented with ArgoCD — QuickInfra's services team covers it end to end.

What We Cover

Managed CI/CD — Full setup and configuration of CI/CD pipelines for your applications. Includes source integration, build pipelines, automated testing stages, and deployment to your target environments.

Kubernetes — Production-grade Kubernetes cluster provisioning and configuration. Includes networking, ingress, autoscaling, RBAC, and monitoring setup tailored to your workloads.

GitOps with ArgoCD — Implementation of a complete GitOps workflow using ArgoCD. Your infrastructure and application state managed declaratively from Git, with automated sync and drift detection.

Advanced DevOps — Custom DevOps architecture, infrastructure design, observability stack setup, secrets management, and any other advanced cloud engineering your team needs but does not have the bandwidth to build internally.

 **Note:** Services are delivered by the QuickInfra engineering team and scoped to your specific environment and requirements. Reach out through this section to discuss your needs and get a proposal.

Key Things to Know

Services are engagement-based — each service is scoped and agreed upon before work begins.

All work delivered through QuickInfra Services is integrated directly into your QuickInfra account — as templates, projects, or configurations you can manage going forward.

Contact the team through this section with a description of what you need and your current setup — the more detail you provide, the faster we can scope and begin.
