

User Profile

User Profile shows your current account details and gives you control over your personal information and security settings. Update your name and email, set your locale, and enable or disable Multi-Factor Authentication for your login.

What is User Profile?

The User Profile page is scoped to the currently logged-in user. It shows your personal information as configured in the system and lets you update what is editable. It also gives you direct control over your account security through the MFA toggle — no admin involvement required to manage your own login security.

The screenshot shows the 'My Profile' page for a user named 'Admin User'. The page is divided into two main sections: 'Personal Information' and 'Security Settings'.

Personal Information:

- First Name:** Admin
- Last Name:** User
- Email Address:** [Redacted]
- Username:** admin (Note: Username cannot be changed)
- Locale:** English (dropdown menu)

Security Settings:

- Multi-Factor Authentication (MFA):** Enabled (toggle switch)
- Set Up MFA:** A QR code is displayed for scanning with an authenticator app.
- Instructions:**
 - Scan the QR code with your authenticator app (Google Authenticator, Authy, etc.)
 - Enter the 6-digit code from your app to verify:
- Verification Code:** 000000

At the bottom right, there are two buttons: 'Cancel' and 'Save Changes'.

The User Profile screen — update personal information and configure Multi-Factor Authentication with a QR code scan.

Personal Information

You can update your **First Name**, **Last Name**, and **Email Address** at any time. Your **Username** is fixed at account creation and cannot be changed. Set your **Locale** to control the language used across the QuickInfra interface.

Multi-Factor Authentication

Toggle **Multi-Factor Authentication (MFA)** on or off from the Security Settings section. When you enable MFA, a QR code is displayed — scan it with any authenticator app such as Google Authenticator or Authy, then enter the 6-digit code to verify and activate. Once enabled, your account will require the MFA code on every login in addition to your password.

✔ **Tip:** Enabling MFA is strongly recommended for admin accounts. It prevents unauthorised access even if your password is compromised.

⚠ **Warning:** If you lose access to your authenticator app with MFA enabled, contact your organisation admin to reset your account. There is no self-service recovery for MFA lockouts.

Key Things to Know

Username cannot be changed after account creation — choose it carefully when the account is first set up by an admin.

MFA is per-user — each team member manages their own MFA setting independently from their profile.

Changes to personal information take effect immediately after clicking **Save Changes**.
